Cropping Patterns of Major Field Crops and Associated Chemical Use

CURRENT SERIAL RECORDS
ACQ/SERIALS BRANCH

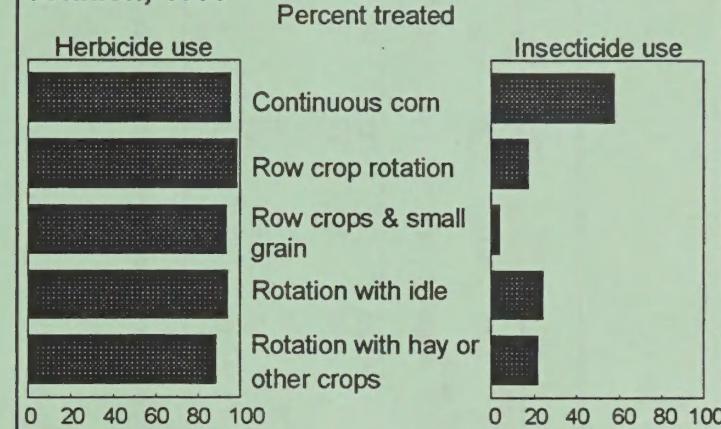

- In 1995, nearly 60 percent of soybean and about half of corn acreage in major producing States were in a corn-soybean rotation. In contrast, over two-thirds of cotton acreage was in monoculture, and the two most popular cropping patterns in wheat-growing States were wheat-fallow rotations and continuous wheat.
- Reduced chemical use was associated with some cropping patterns: less nitrogen was used on corn and wheat when preceded by hay, pasture, and other crops; less insecticide was used on corn and wheat when preceded by row crops and small grains.

Information on cropping patterns adopted by the growers of major field crops and on associated use of nitrogen, herbicide, and insecticide comes from 1995 Cropping Practices Survey. Cropping patterns include monoculture (same crop is planted in the same field for 3 consecutive years) and crop rotations (different crops are planted every year or every other year on the same field). Potential benefits of cropping diversity on a specific field include increased nitrogen content of soil through planting of legumes; reduced incidence of plant disease and insect and weed problems; reduced loss of soil, nutrients, and moisture; increased organic matter and water-holding capacity of the soil; and reduced water pollution associated with runoff and leaching.

Land in corn. The two most dominant cropping patterns in the major corn-growing States in 1995 were corn in rotation with soybeans on 47 percent of the corn acreage, and continuous corn, on 21 percent (table 1). Nebraska was the leading State in continuous corn with more than half of its corn acreage in this pattern. The rotation of corn and soybeans, on the other hand, was prevalent in Midwestern States. Lower levels of nitrogen fertilizer and insecticide were applied on fields where corn was preceded by row crops and small grains.

Land in soybeans. Soybeans in rotation with corn was the predominant cropping pattern in the major soybean-growing States, occurring on nearly 60 percent of the soybean acreage (table 2). In contrast, continuous soybeans (monoculture) occurred on only 10 percent of the acreage. Northern States more frequently

Corn acres treated with pesticide, by crop rotation, 1995

Source: USDA, ERS, Cropping Practices Survey data.

grew soybeans in rotation with corn, whereas Southern States more frequently practiced monoculture. Because soybeans are a nitrogen-fixing crop, only 12 to 30 percent of the soybean acreage received nitrogen fertilizer application.

Land in cotton and wheat. The predominant cropping patterns in the major wheat-growing States were wheat-fallow and continuous wheat (tables 3 and 4). In the moisture-limited Great Plains, farmers prefer the moisture-conserving wheat-fallow rotation. Continuous wheat, on the other hand, is the preferred pattern in Oklahoma, Texas, and Kansas. Lower application rates of nitrogen fertilizer were associated with wheat preceded by hay and pasture, and less insecticide use with wheat preceded by row crops and small grains. Geographic differences in wheat insect infestations may be a factor in the latter. In 1995, 68 percent of the cotton acreage in the 6 major cotton-growing States followed a continuous cotton pattern (table 5). Cotton in rotation with row crops accounted for 21 percent. Acreage in cotton received more insecticide application than acreage in corn, soybeans, or wheat.

About AREI UPDATES

AREI UPDATES is a periodic series that supplements and updates information in Agricultural Resources and Environmental Indicators (AREI), USDA, ERS, AH-705, Dec. 1994. UPDATES report recent data from surveys of farm operators and others knowledgeable about changing agricultural resource use and conditions, with only minimal interpretation or analysis. Please contact the individual listed at the end of the text for additional information about the data in this UPDATE. If you would like to be added to the mailing list or have other questions about AREI UPDATES or AREI, contact Richard Magleby, (202) 219-0436. [rmagleby@econ.ag.gov]
